

Mitosis

Cell division of somatic (body) cells
Results in identical pair of cells

Meiosis

Cell division of gametes (sex cells)
Results in 4 daughter cells w/ only half of the genetic information

• Allows for evolution - parents' genetic info is combined
(law of) Independent Assortment, recombination, mutation $\Rightarrow$ variation

↓
all other traits segregate independently, allowing
for new combinations of traits. With

the exception of linkage traits are completely separate
